AMENDMENTS TO THE CLAIMS

1. (ORIGINAL) A method of controlling or modeling the process

of densifying at least one porous substrate with pyrolytic

carbon by chemical vapor infiltration, the process comprising:

placing a load comprising one or more porous substrates to be

densified in an oven; heating the substrate(s); admitting a

reaction gas into the oven, the reaction gas containing at least

one carbon-precursor hydrocarbon; adjusting the pressure in the

oven so as to enable the gas to diffuse within the pores of the

heated substrate(s) so as to form a deposit of pyrolytic carbon

therein; and extracting effluent gas from the oven via an

extraction pipe connected to an outlet from the oven;

the method being characterized by measuring the content in

the effluent gas of at least one compound selected from allene,

propine, and benzene; and, as a function of the measured

content, by controlling the process by adjusting at least one

parameter selected from: the flow rate of the reaction gas

admitted into the oven, the flow rate of at least one component

of the gas admitted into the oven, the transit time of the gas

through the oven, the temperature to which the substrate(s)

is/are heated, and the pressure that exists inside the oven.

Confirmation No.:

2. (ORIGINAL) The method according to claim 1, characterized

in that at least one parameter is adjusted so as to maintain the

measured content at a value that is substantially constant.

3. (ORIGINAL) A method according to claim 1 or claim 2,

characterized in that the content is measured in a duct in

parallel with the extraction pipe.

(CURRENTLY AMENDED) A method according to any of-claims 1

to 3, characterized in that the content is measured by gas

chromatography.

5. (CURRENTLY AMENDED) A method according to anyone of claims

1—to—4, characterized in that the method is controlled by

adjusting the flow rate of the reaction gas, or the flow rate of

a component of the reaction gas as a function of the measured

allene and/or propine content.

(CURRENTLY AMENDED) A method according to anyone of claims 6.

1-to-4, characterized in that the method is controlled by

adjusting the temperature to which the substrate(s)

heated as a function of the measured benzene content.

Confirmation No.:

7. (CURRENTLY AMENDED) A method according to anyone of claims

1-to-6, characterized in that the reaction gas comprises at

least one component selected from alkanes, alkynes, and alkenes.

(CURRENTLY AMENDED) A method according to anyone of claims 8.

1—to-7, characterized in that the reaction gas comprises a

precursor which is selected from propane, butane, and ethane and

which is diluted in methane.

9. (CURRENTLY AMENDED) A method according to anyone of claims

1-to-8, characterized in that the selected parameter is adjusted

within a predetermined range of values.

10. (CURRENTLY AMENDED) Α method according to claim 9,

characterized in that the end of the densification process is

detected by it becoming impossible to control the variation in

the measured content by adjusting the selected parameter.

(CURRENTLY AMENDED) A method according to anyone of claims 11.

1-to-10, characterized in that the variation in the or each

adjusted parameter is stored so as to constitute a model that is

reproducible during a subsequent process of densifying a load of

the same type.

12. (CURRENTLY AMENDED) A method according to claims 10 and

11, characterized in that the end of the densification process

is detected by it becoming impossible to control the variation

in the measured content by adjusting the selected parameter and

that the duration of the densification process is also stored.

13. (NEW) A method according to claim 3, characterized in

that the content is measured by gas chromatography.

(NEW) A method according to claim 13, characterized in

that the method is controlled by adjusting the flow rate of the

reaction gas, or the flow rate of a component of the reaction

gas as a function of the measured allene and/or propine content.

15. A method according to claim 13, characterized in

that the method is controlled by adjusting the temperature to

which the substrate(s) is/are heated as a function of the

measured benzene content.

16. A method according to claim 15, characterized in

that the reaction gas comprises at least one component selected

from alkanes, alkynes, and alkenes.

17. (NEW) A method according to claim 16, characterized in

that the reaction gas comprises a precursor which is selected

from propane, butane, and ethane and which is diluted in

methane.

18. (NEW) A method according to claim 17, characterized in

that the selected parameter is adjusted within a predetermined

range of values.

19. (NEW) A method according to claim 18, characterized in

that the end of the densification process is detected by it

becoming impossible to control the variation in the measured

content by adjusting the selected parameter.

20. (NEW) A method according to claim 19, characterized in

that the variation in the or each adjusted parameter is stored

so as to constitute a model that is reproducible during a

subsequent process of densifying a load of the same type.
